PENTALYM **SCAN**

Make any place your workplace.

Scan is the easy way to keep track of your products anywhere – turning your mobile phone into a scanner.

The **Scan** app updates product location information in real time. Each time your product is detected by a scan-ready device, this information is stored and displayed within the **Track** app.

With the **Scan** app on your smartphone, you can securely connect via Bluetooth® to a handheld reader. This reader then detects any nearby devices once you commence the scan. Each enabled device sends its unique IDs and location to your phone. You can also find sublocations based on account records in Salesforce and see these on a map using the **Track** app.

Scan app benefits:

• Using the **Scan** app enables teams to provide real-time location information on any product, anywhere.

• Team members can scan thousands of items in minutes to provide a fast and efficient inventory history that can be connected to analytics and reporting tools.

• Warehouses can automate the application of tags for all product ranges – allowing real time inventory traceability and faster counting of large stock volumes.

• The whole process is secure and encrypted to protect your privacy and your scanned devices.
